CSE 465. Sec: 02

# Objective:

- Determine cotton plant and leaf disease.
- Identify fresh cotton leaf , diseased cotton leaf, fresh cotton tree and diseased cotton tree by image processing.
- The problem was to predict and determine cotton plant disease.

# Algorithms we used:

We used Convolutional Neural Networks (CNN).  
Architecture: ResNet 50 ,VGG 16 and custom.

## Custom Network:

1.Convolutional Layer - 2  
Max Pooling layer - 2  
Flatten and Dense layer  
Input size:  $64*64$

2. Convolutional Layer - 4  
Max Pooling layer - 3  
Flatten and Dense layer  
Input size:  $224*224$

# Result and Discussion:

Our designed architecture shows highest accuracy 97% besides VGG16 shows 96% Accuracy which is pretty good. On the other hand, ResNet50 has given lower accuracy may be the reason is small dataset. Table 1 shows final result.

Architecture	Accuracy	Validation Accuracy	Loss
VGG16	96%	96%	11%
ResNet50	65%	76%	
Custom	97%	91%	7%

Table 1: Result

Figure 1: Model accuracy

Figure 2 shows that, train loss decreased gradually. Test loss also decreased gradually but the curve is not smooth.
